

Health Promotion: Elevating Taha Tinana

**Year 9 Health and
Physical Education**

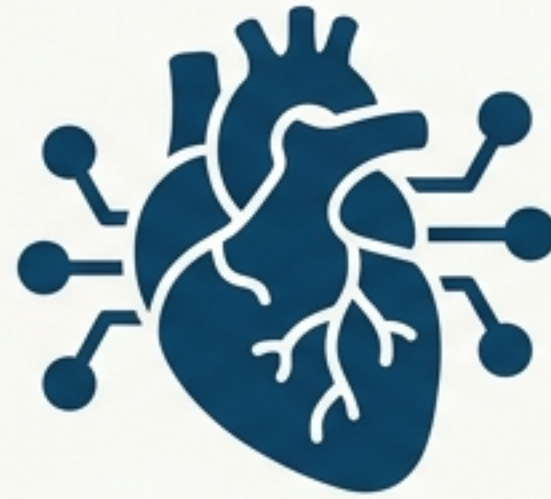

Your Mission Parameters

Target 1

Build a targeted programme to improve your own Taha Tinana.

Target 2

Decode how your body responds dynamically to physical activity.

Target 3

Master health hygiene practices to uplift your hauora and demonstrate manaakitanga to others.

The Toolkit: Gear Up

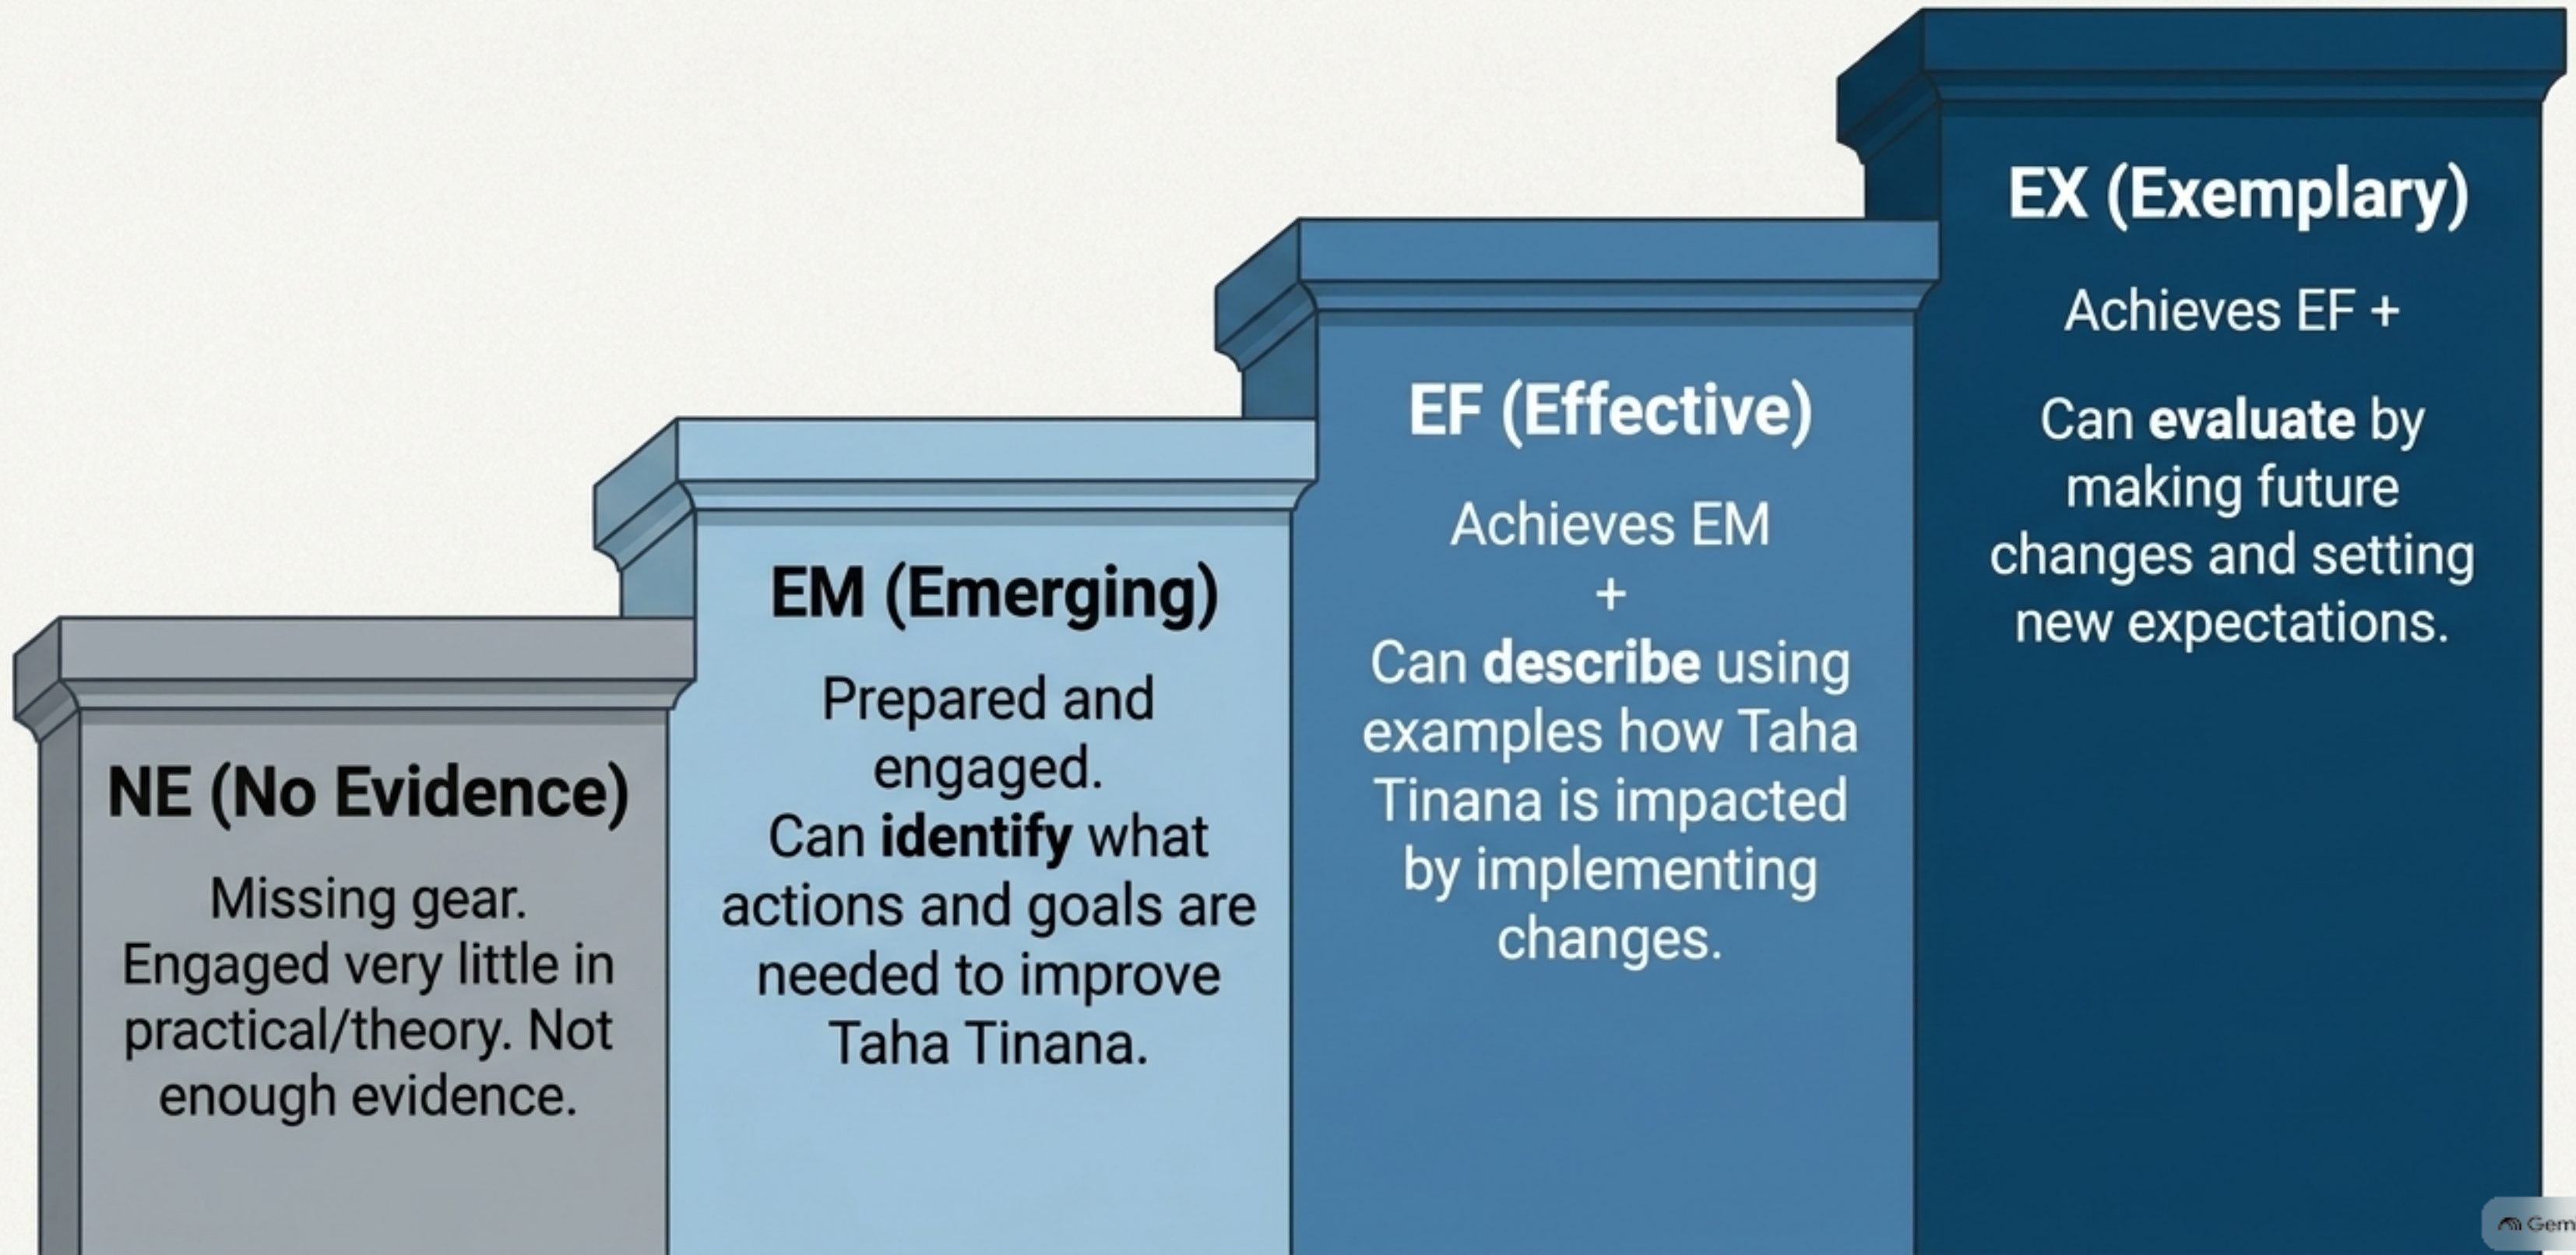

To enter the lab each lesson, you need your equipment:

- Chromebook & Pen (For the theory)
- PE Uniform (For the practical)

Integrity Check

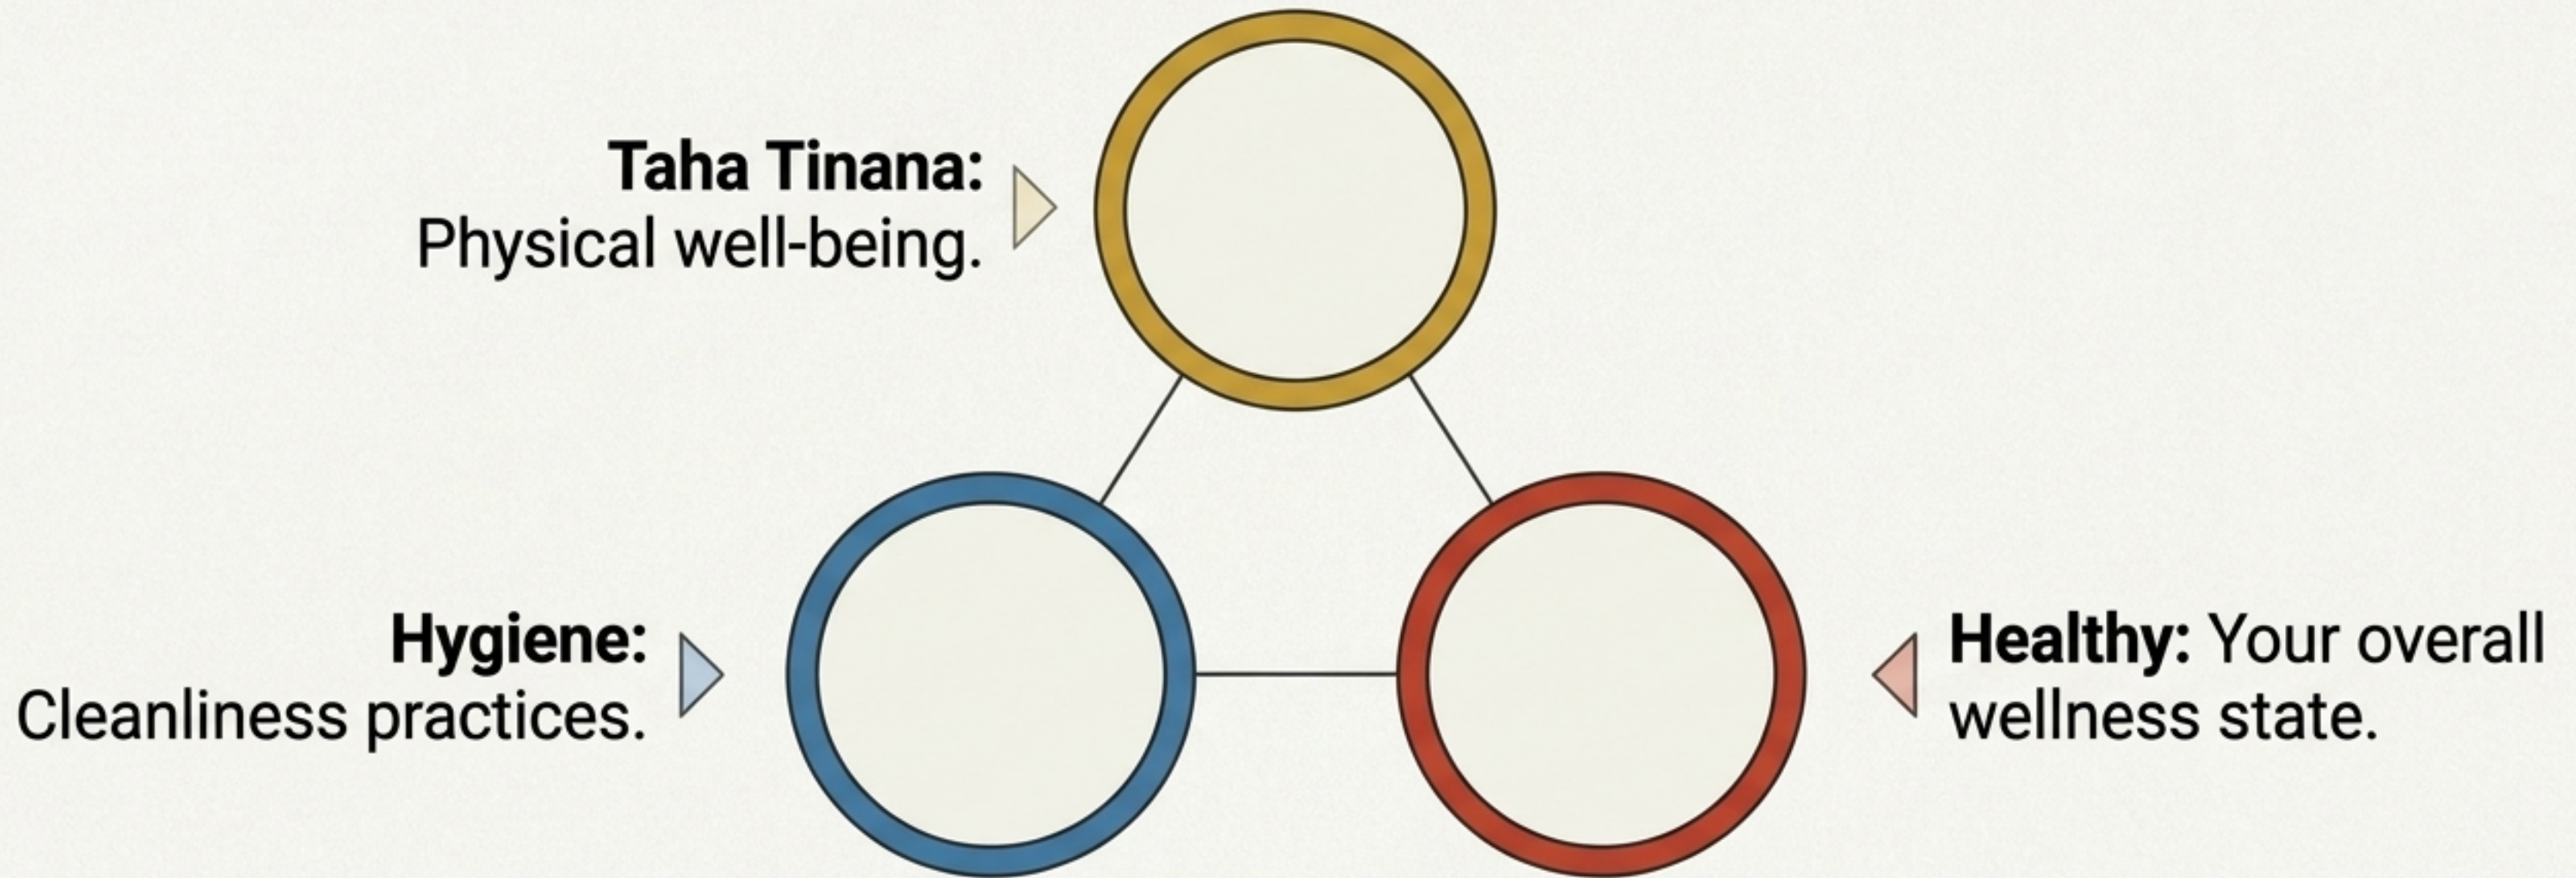

Your work must be completely your own. Any plagiarism results in an automatic No Evidence (NE) grade and contact with your whānau.

How to Level Up

The Foundations (Task 1)

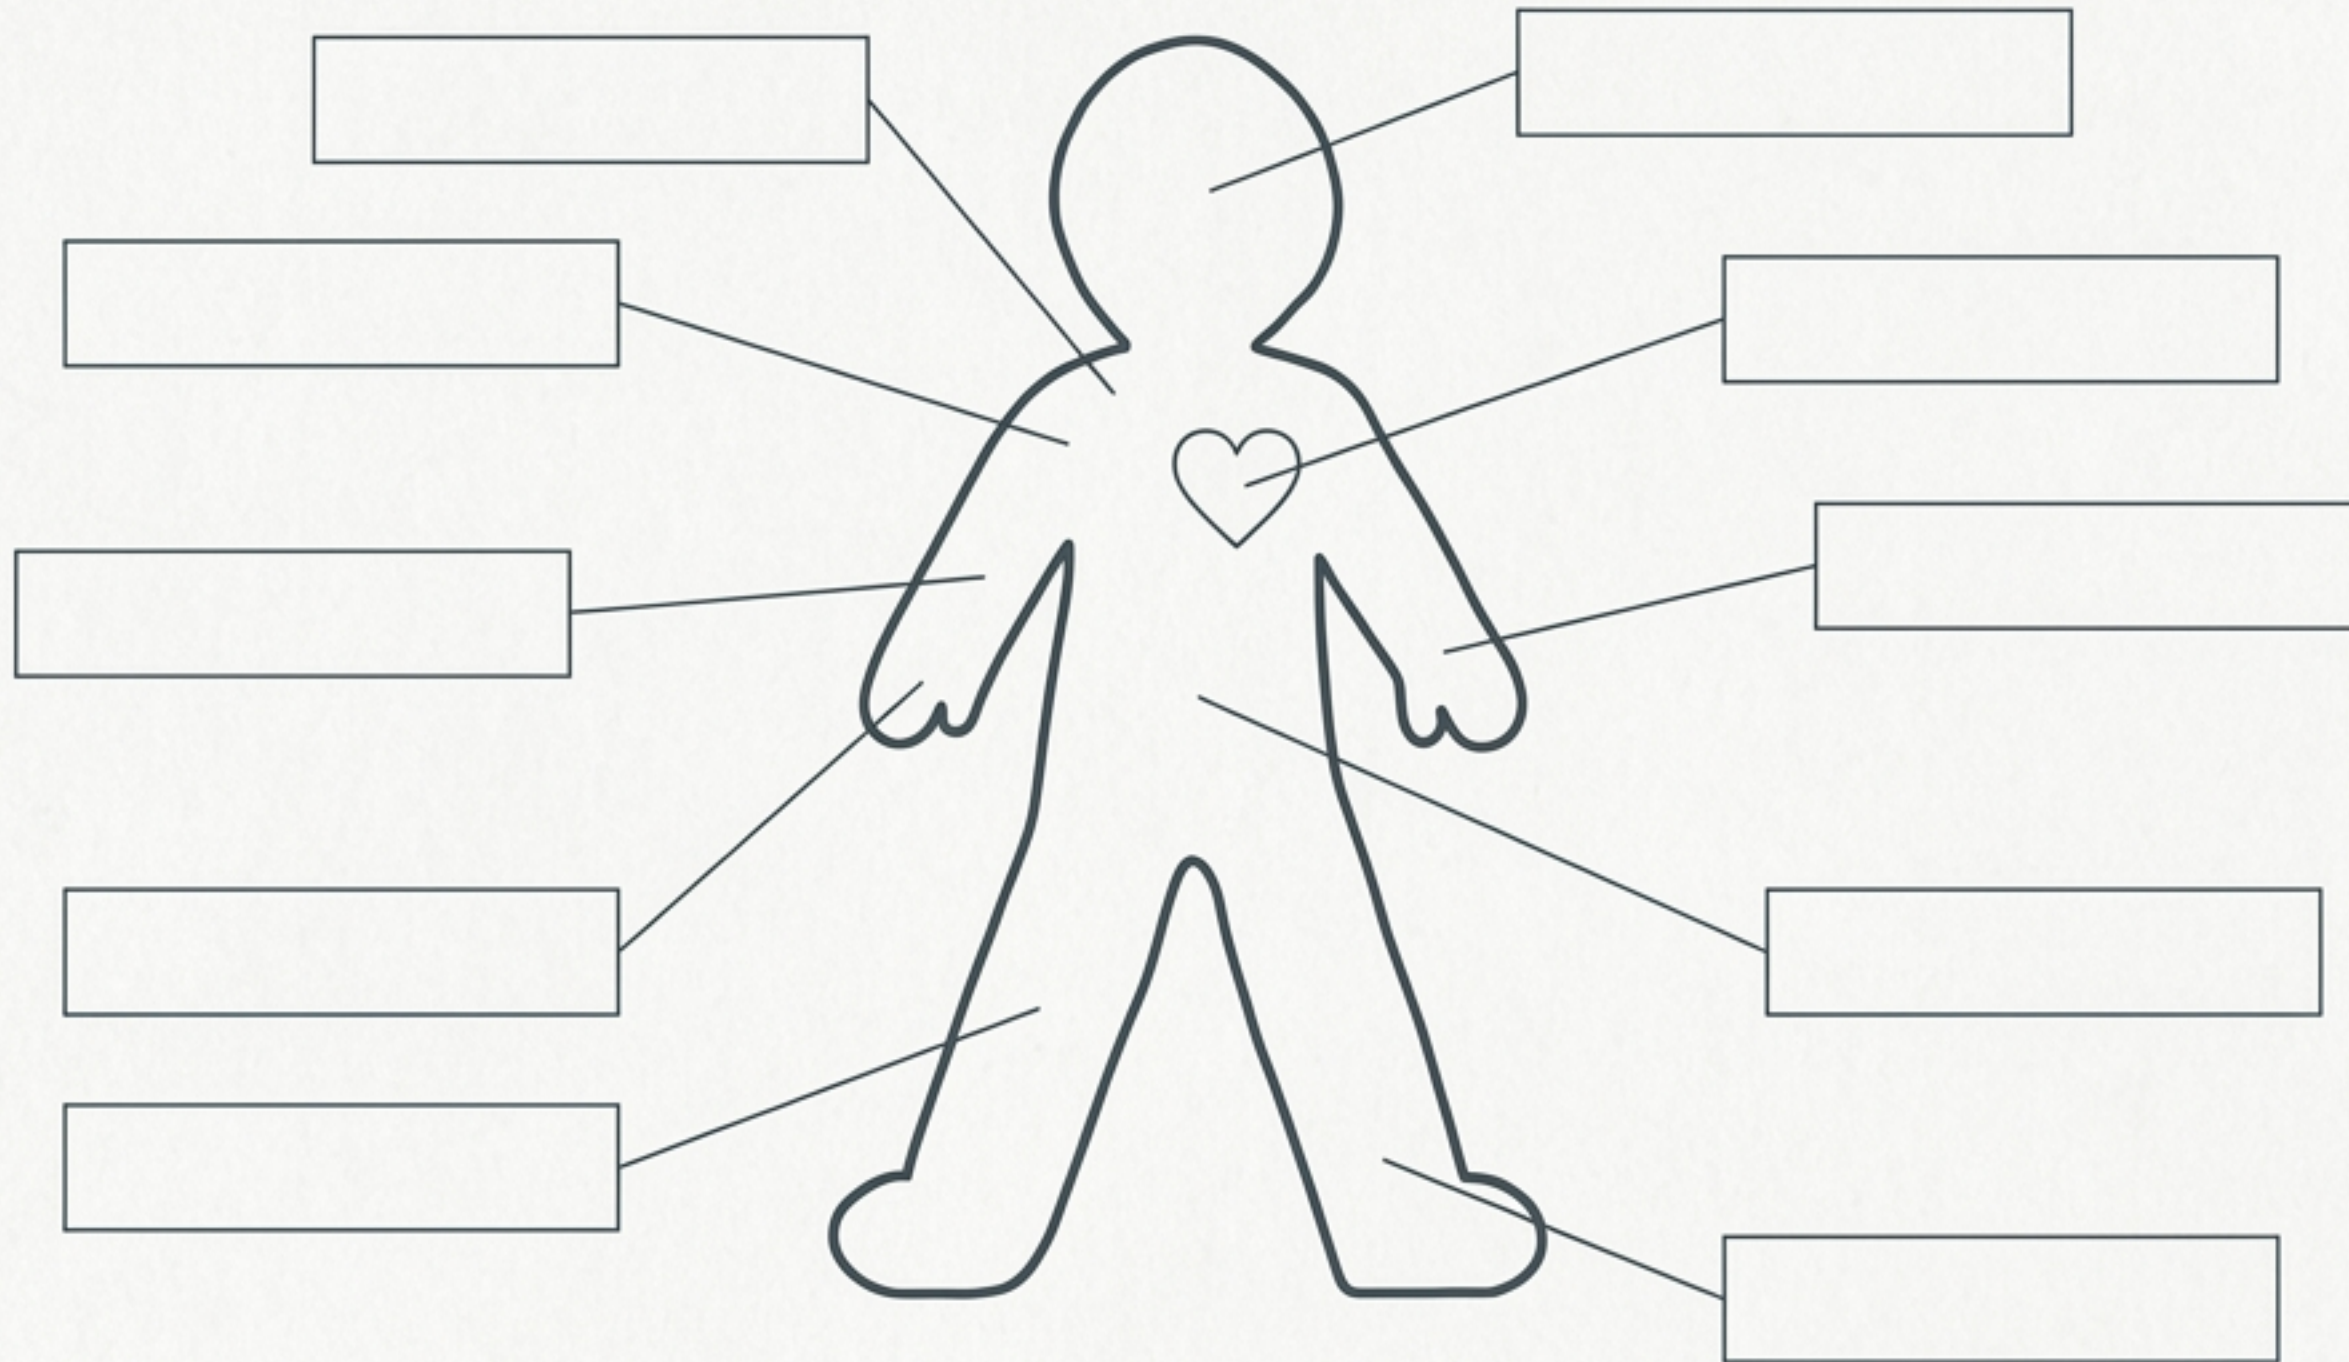

Before we optimize the system, we need to **define the parameters**.
In your workbook, you will define, draw, and exemplify:

Your Task: What do these mean in your world?

Deconstructing a Healthy Person (Task 2)

What builds this avatar? Around the outline in your workbook, brainstorm every input required for a healthy human system. Think beyond the obvious: consider movement, fuel, sleep, mindset, and connection.

Taha Tinana

Hygiene is Manaakitanga

Hygiene isn't just about optimizing your own Taha Tinana. It is an active demonstration of respect, care, and hospitality for those sharing your space. When you protect your own system, you protect your whānau.

Whānau / Community

The Shield Matrix (Task 3)

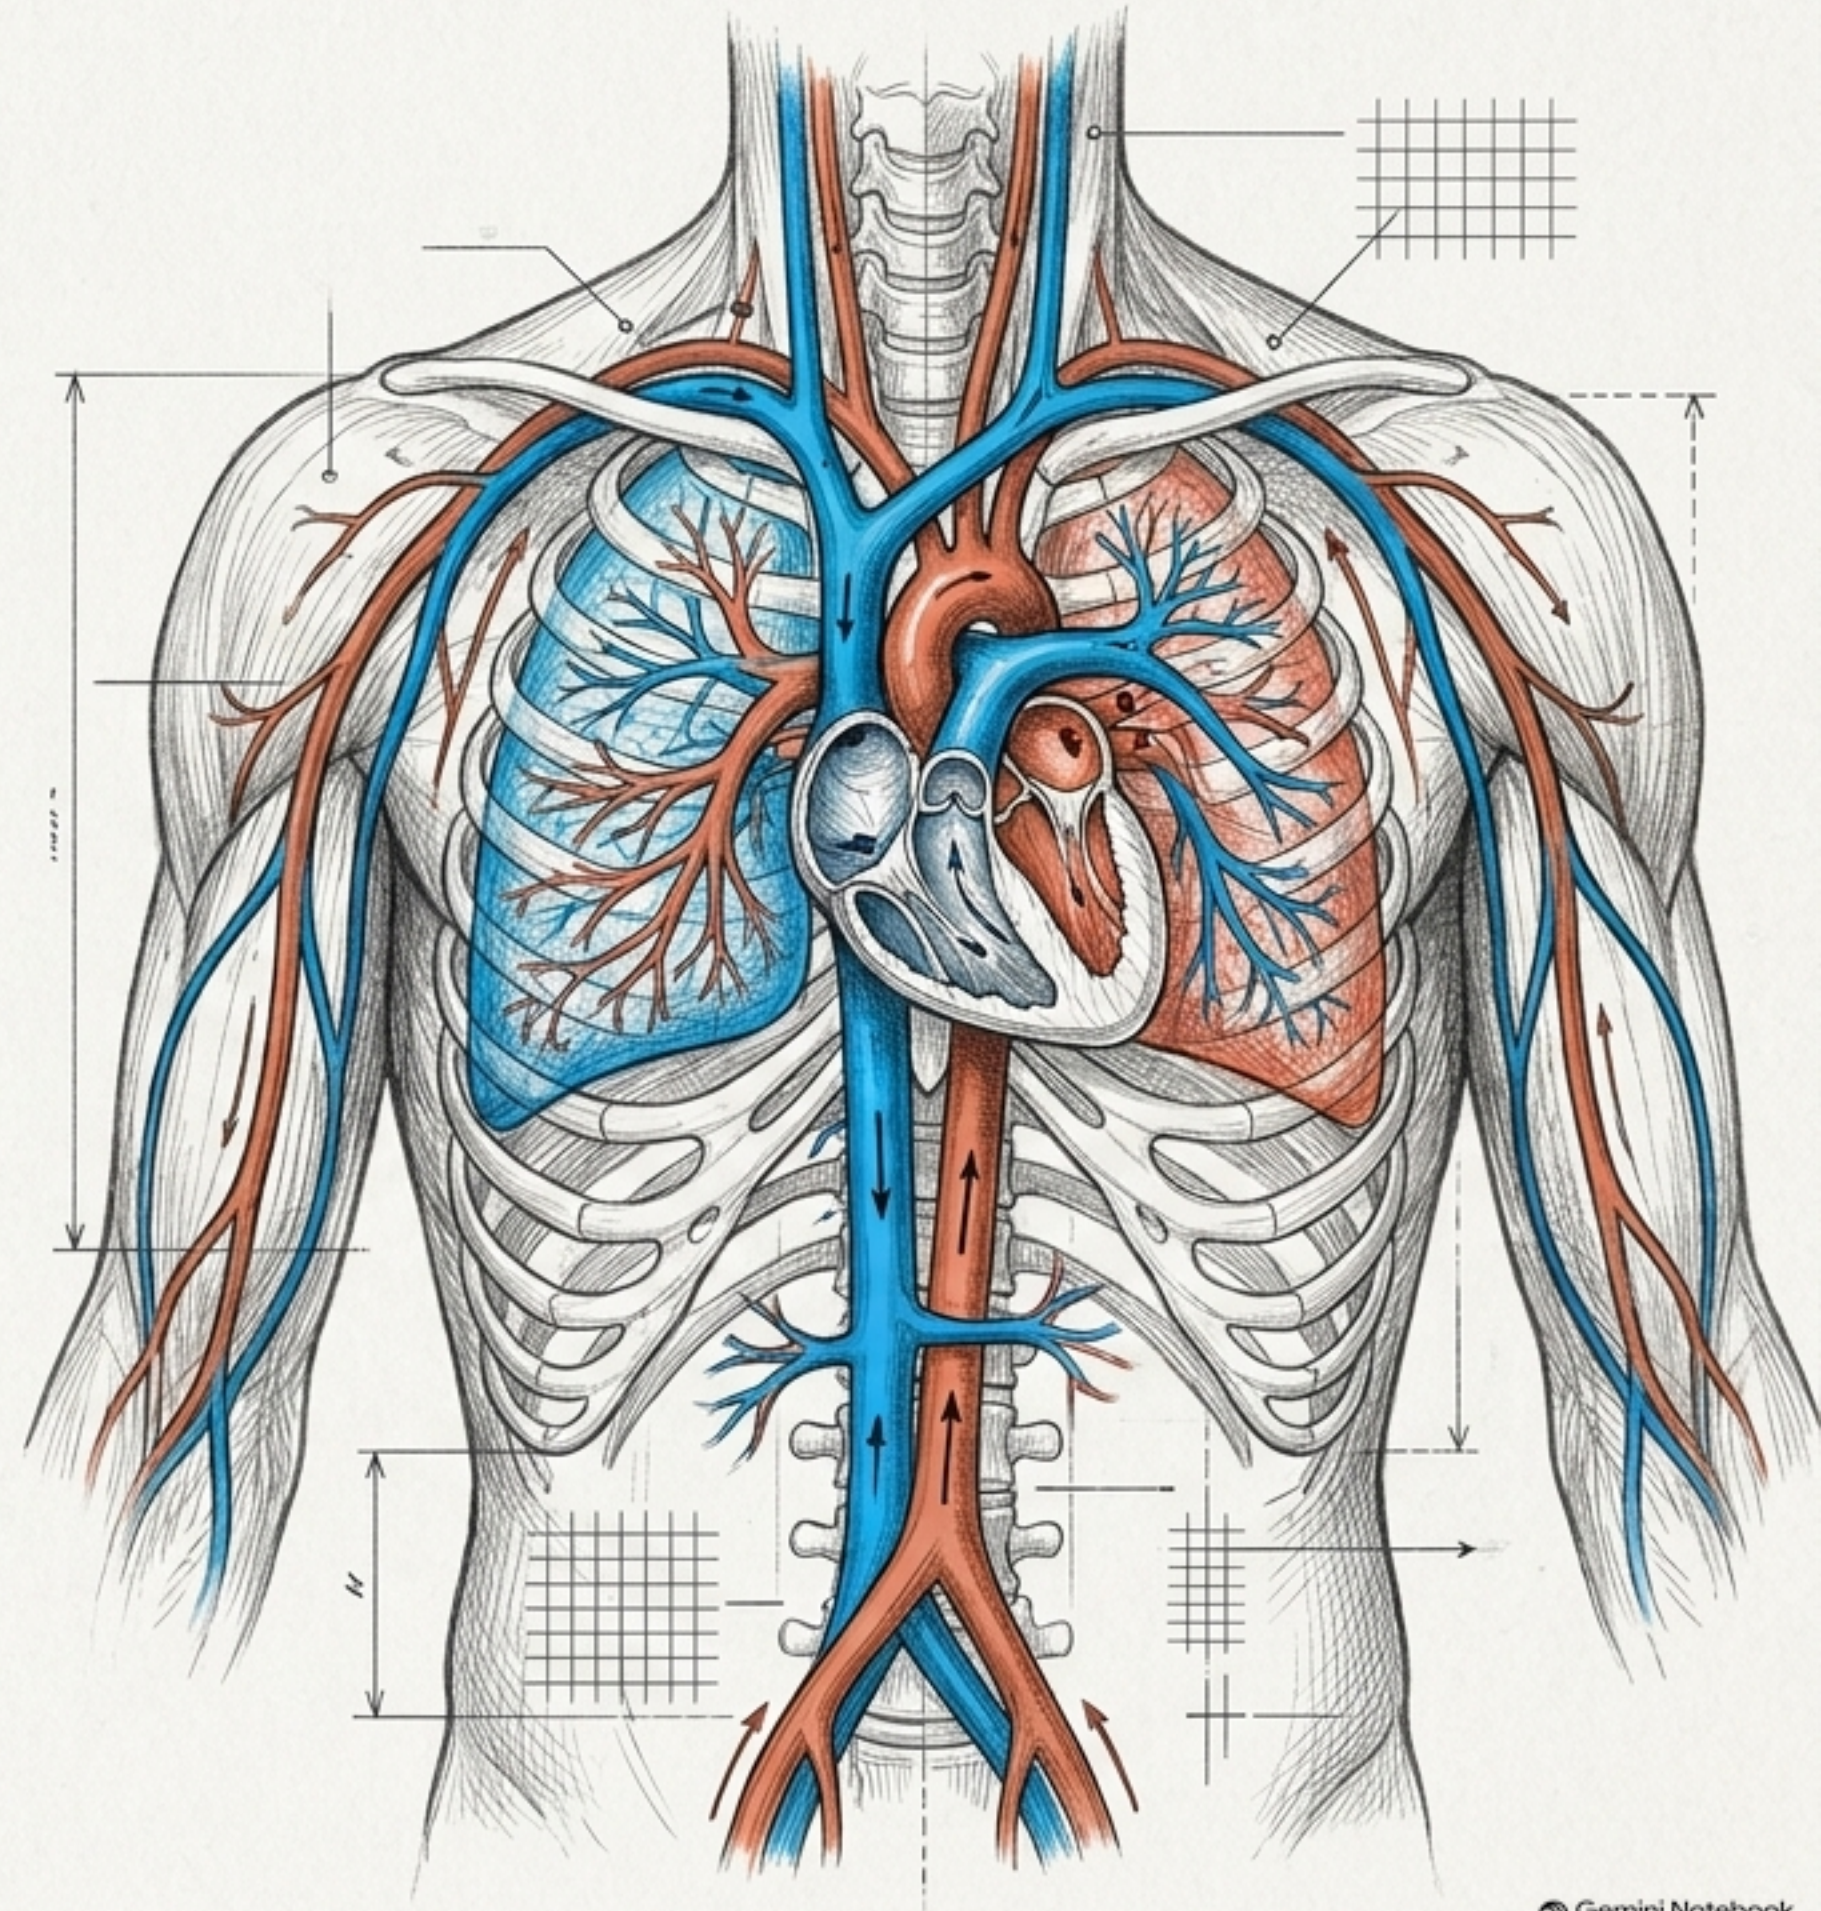

Map the required practices in your workbook:

Practice	Impact on Self (Taha Tinana)	Respect for Others (Manaakitanga)
 Coughing	Prevents your own illness from escalating.	Shields others from airborne germs.
 Body odour		
 Teeth		
 Physical activity		
 Feet		
 Period		
 Face & skin		
 Washing hands		

The Engine Room (Task 4)

Action and Reaction.

When we introduce the stimulus of physical activity, what exactly happens under the hood?

Physiological Chain Reactions

Track these 5 responses in your workbook. Describe what happens, why it takes place, and the benefit to your system.

Temperature:
The engine heats up; sweat cools it down.

Blood Pressure:
Increases flow to active muscle groups.

Heart Rate:
Pumps fuel and oxygen faster.

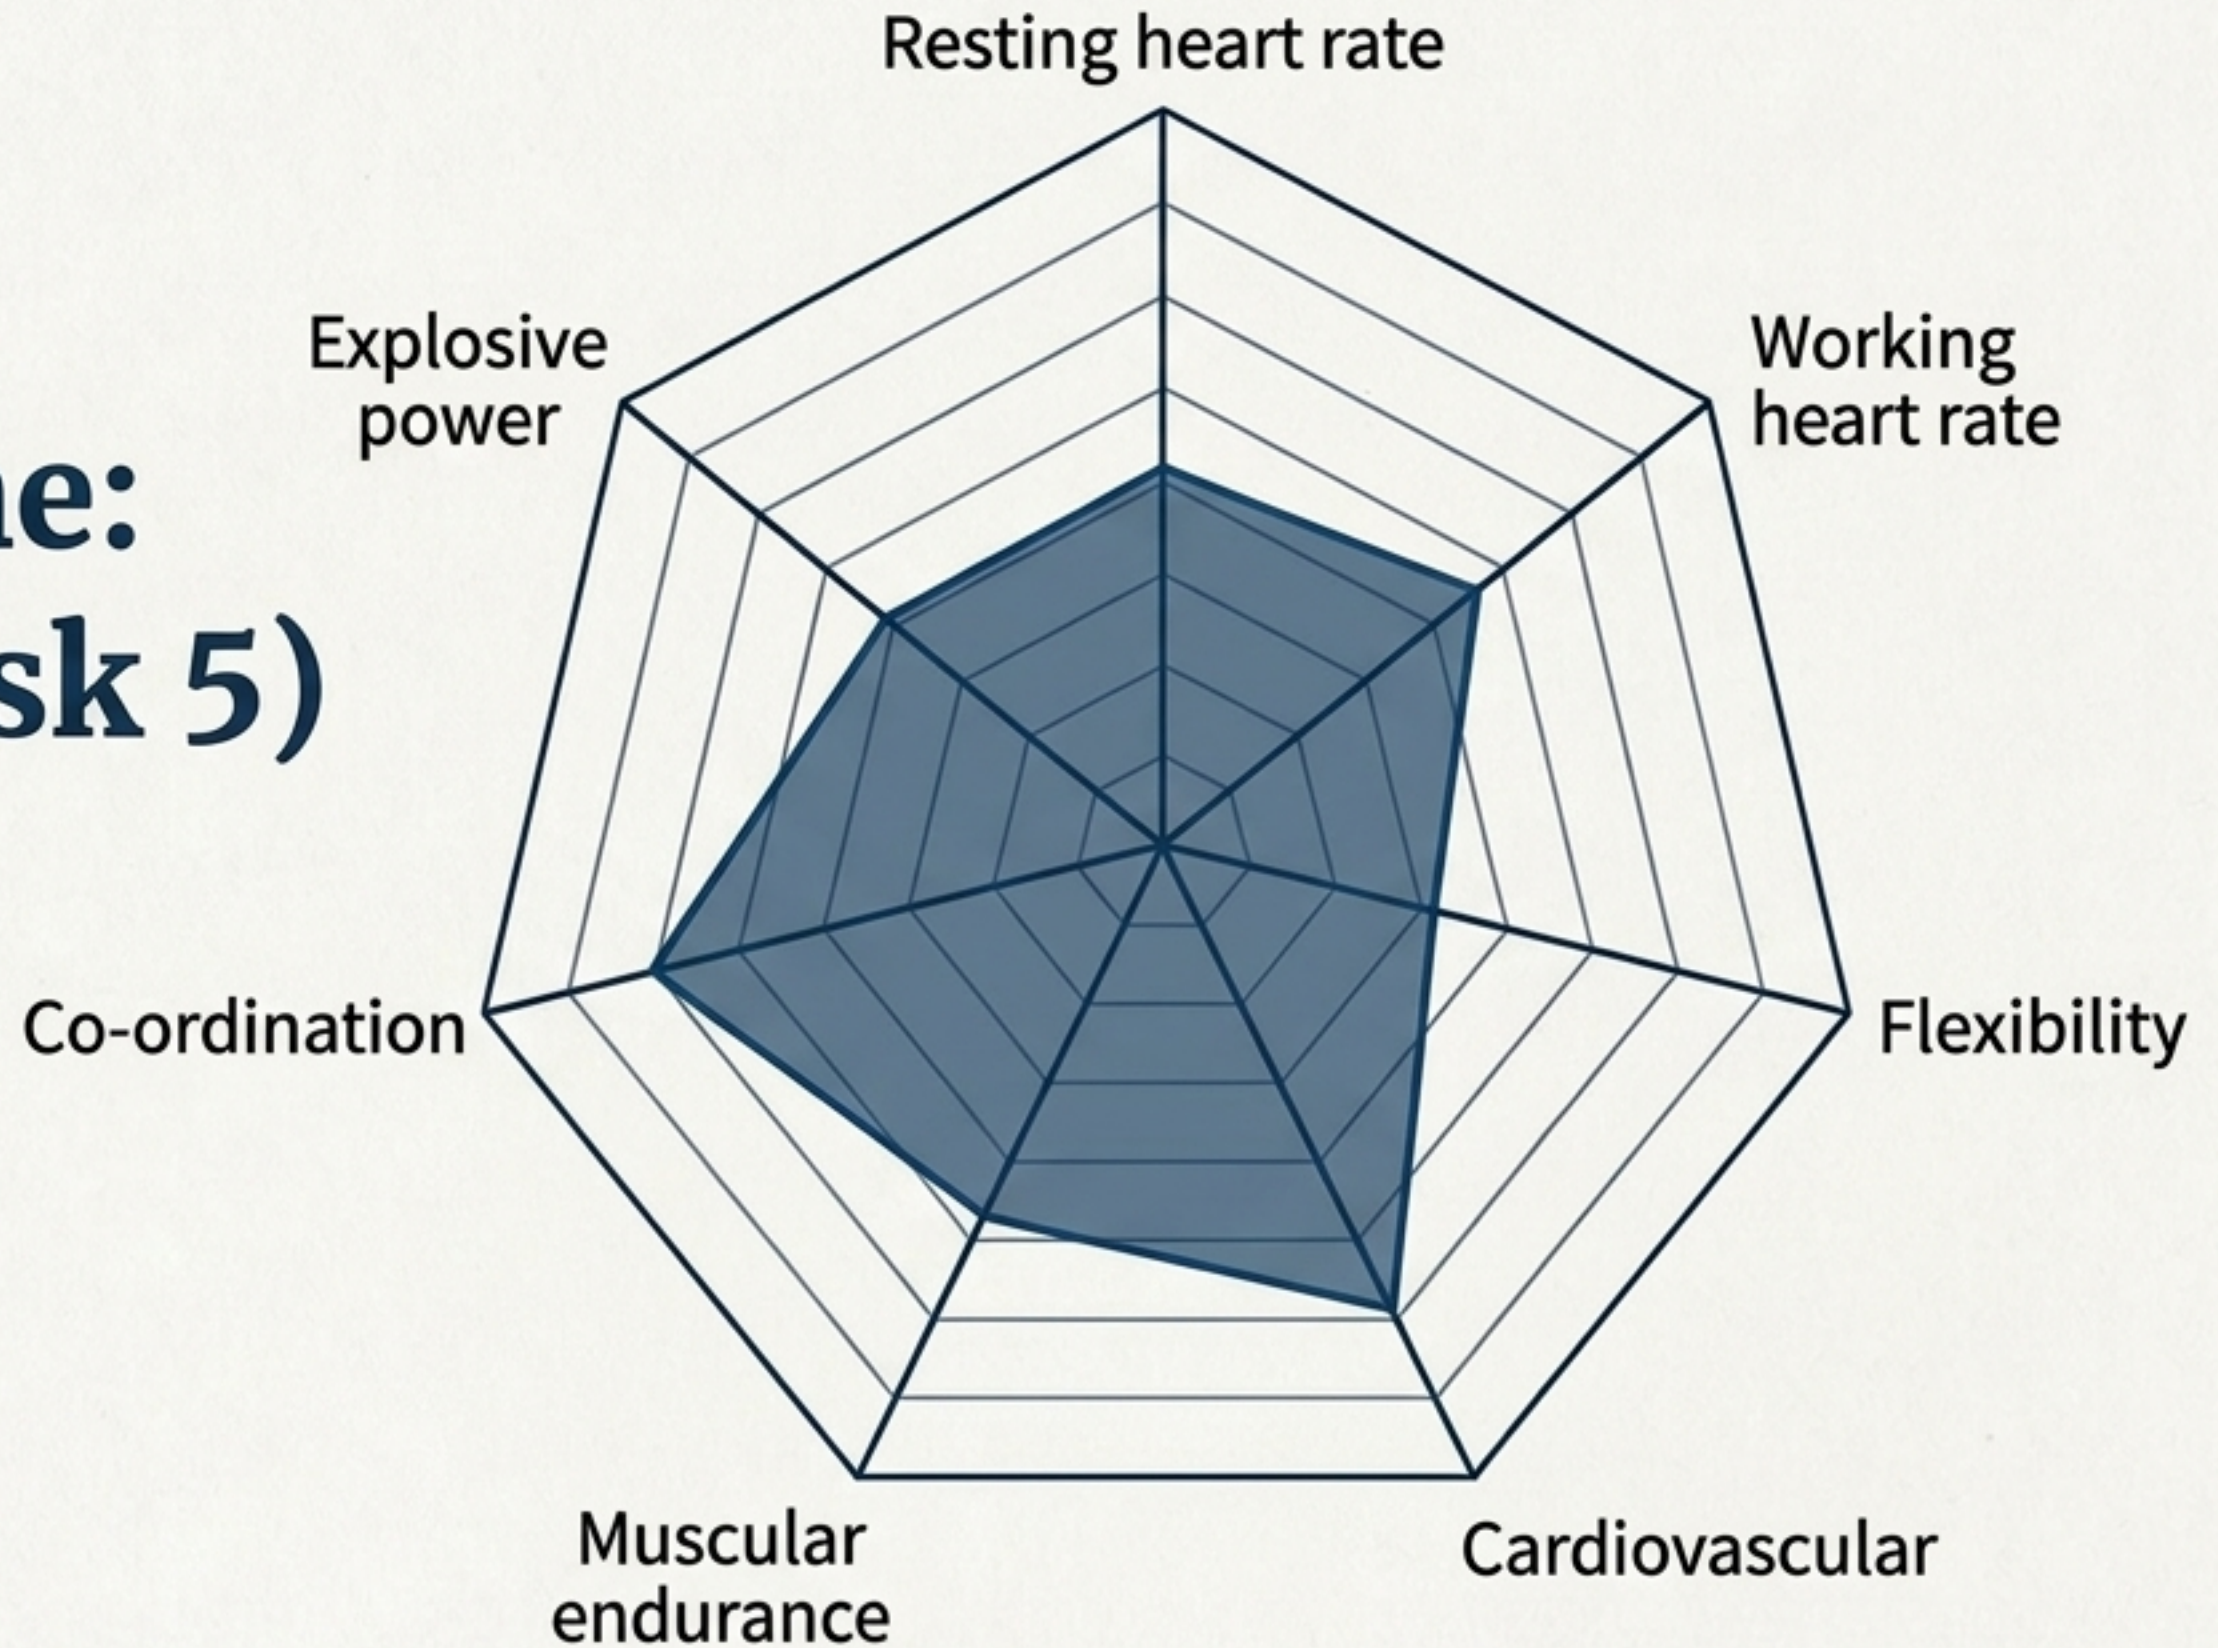

Breathing Rate:
Intake of oxygen, exhaust of carbon dioxide.

Hormonal:
Endorphins and adrenaline mobilize energy and focus.

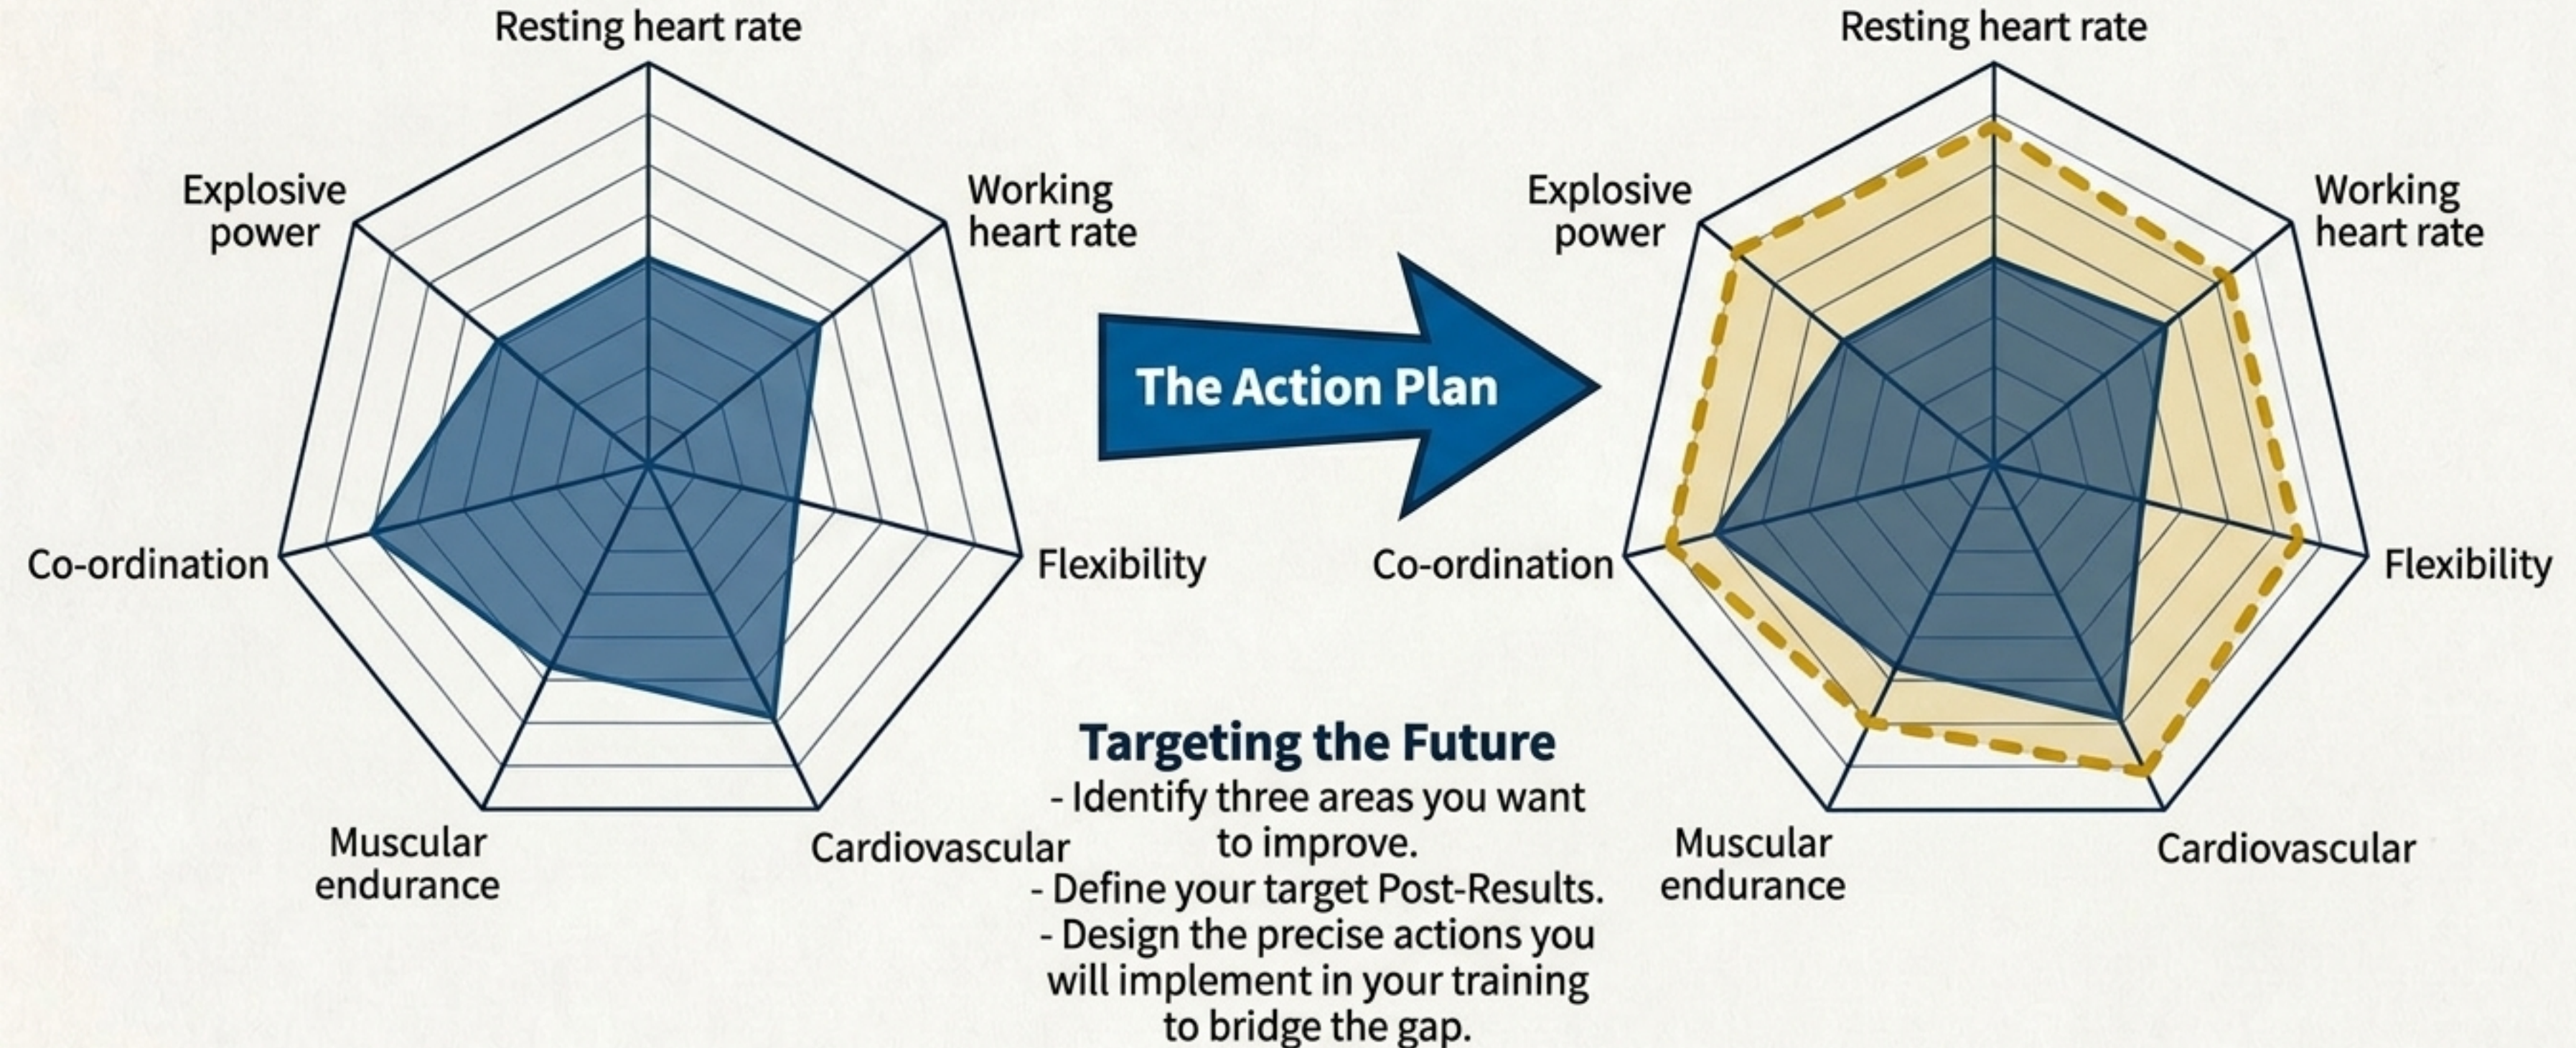

The Starting Line: Player Stats (Task 5)

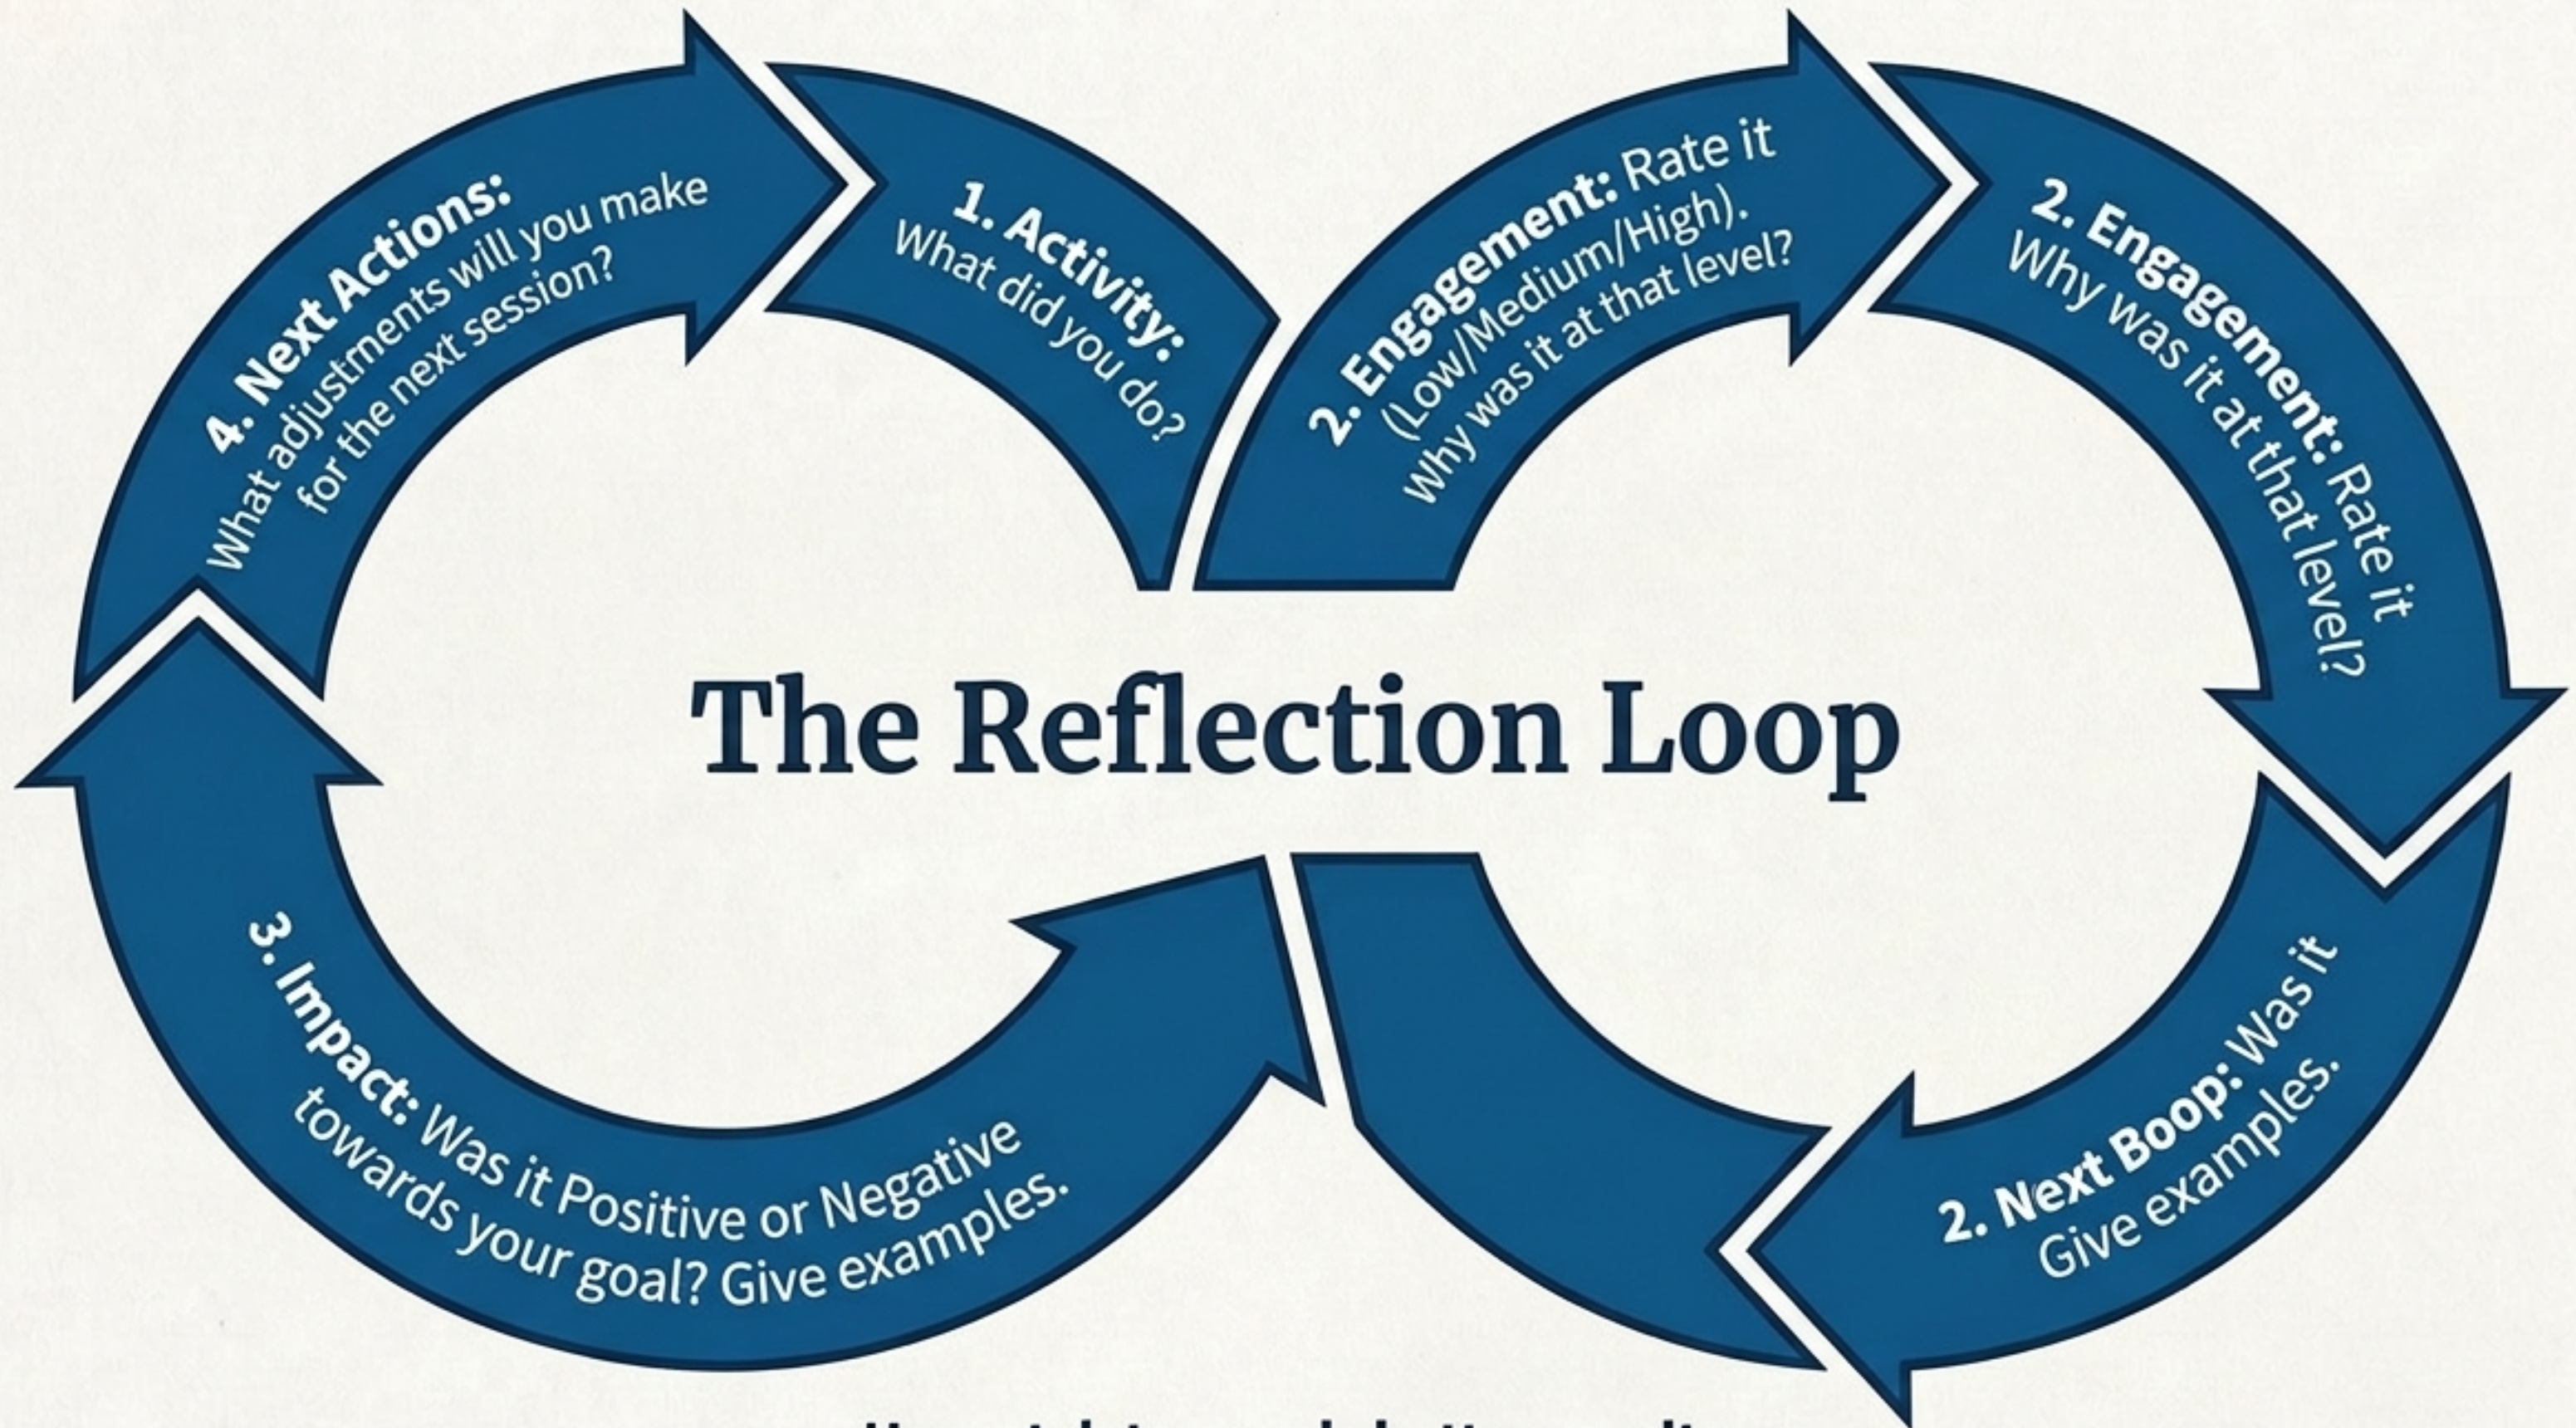

No judgment, just data. Your Learning Leader will guide you through challenges to log your Pre-Results.

Targeting the Future: Bridging the Gap

From your baseline data, where do you want to level up?

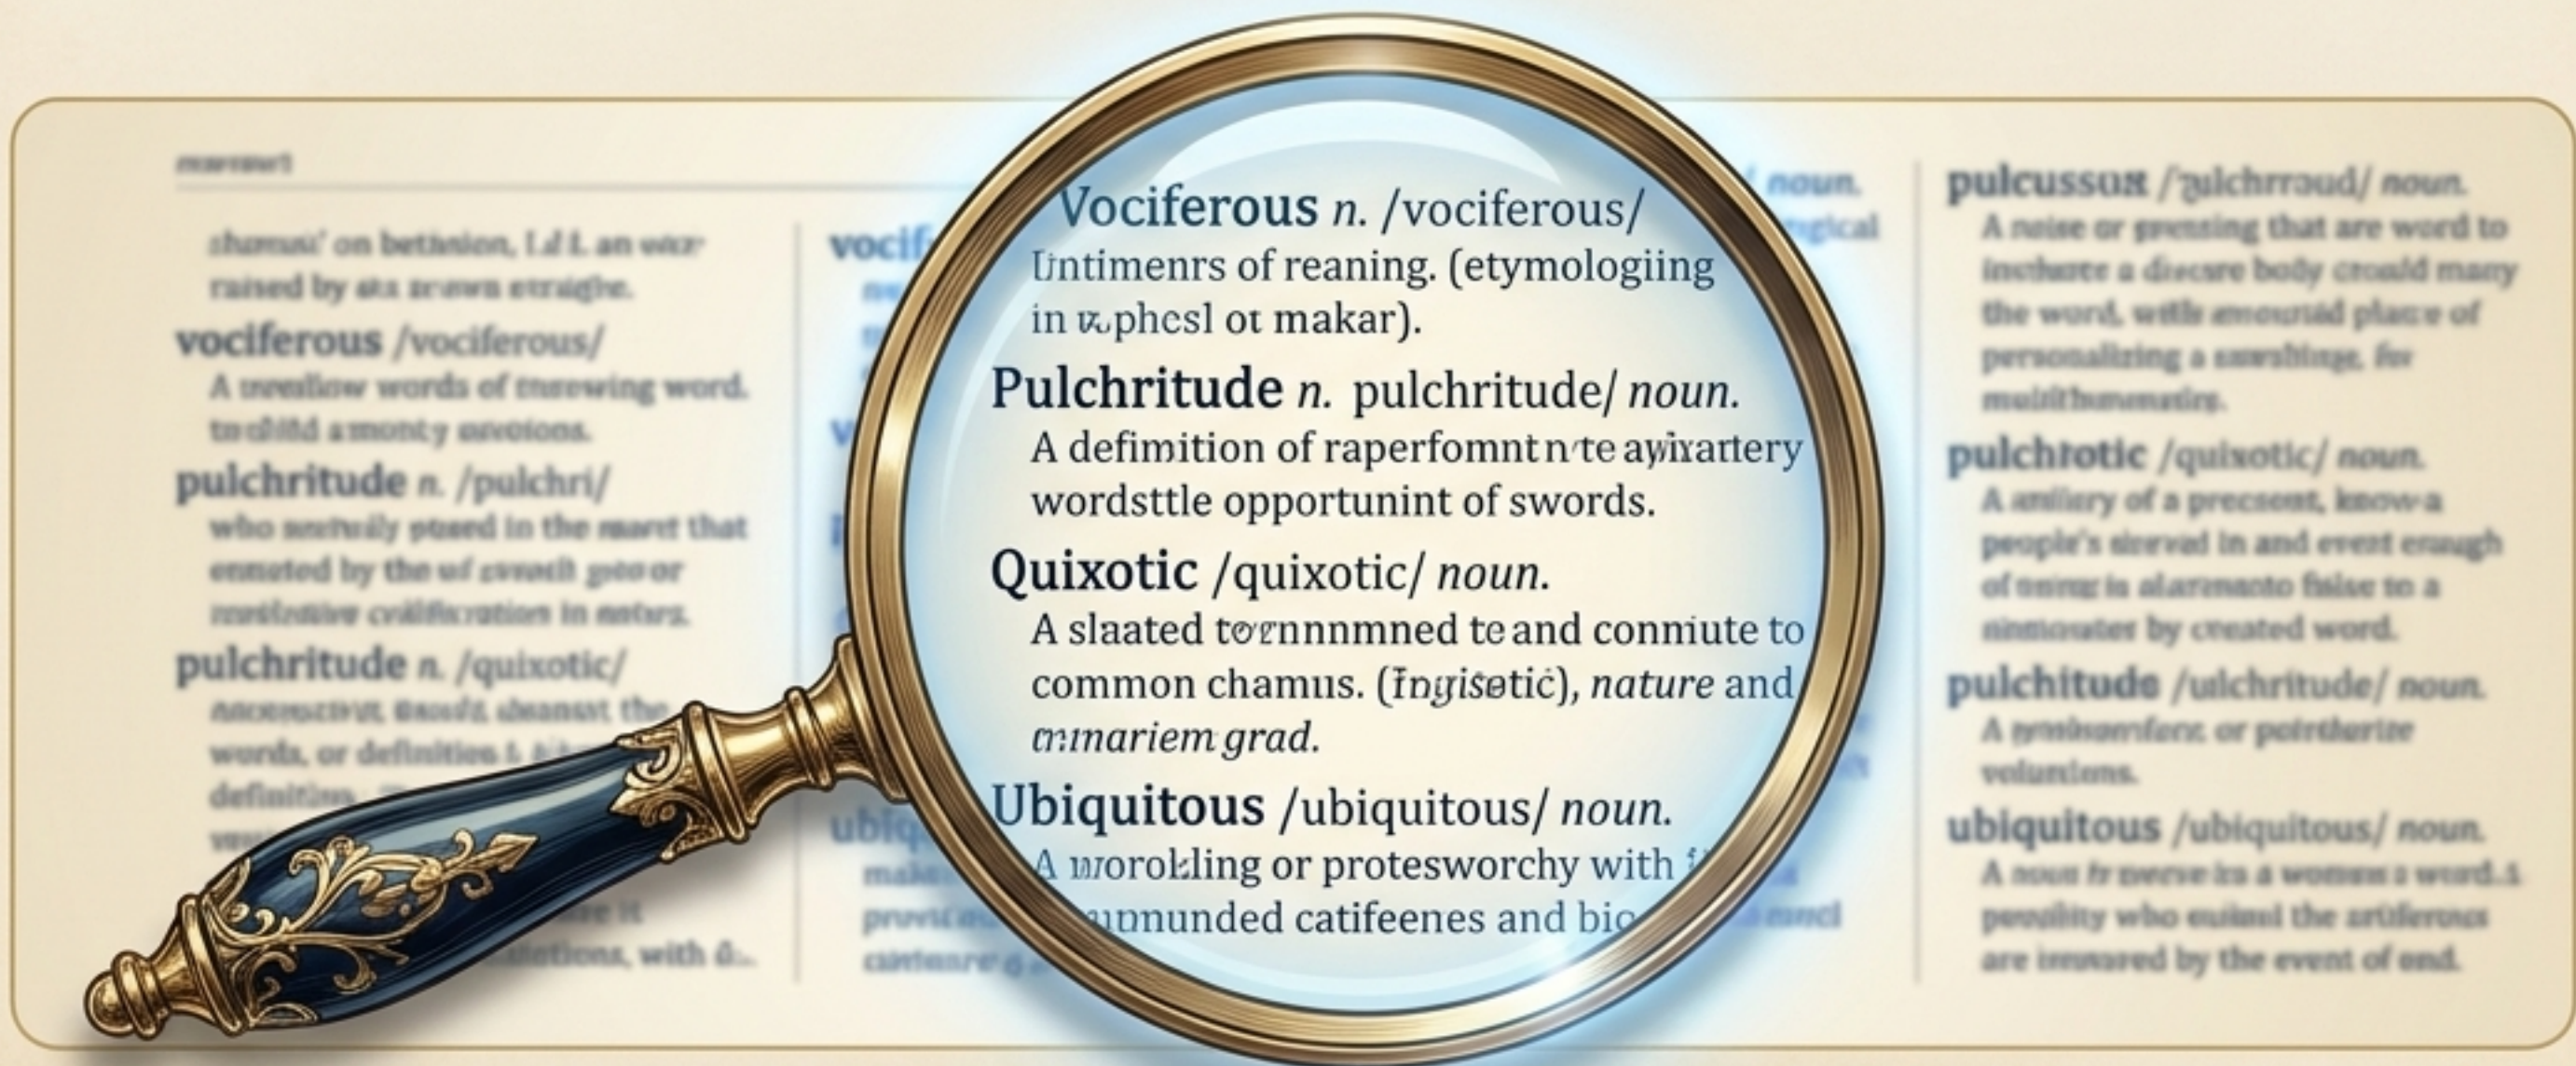

Honest data equals better results.
After each practical lesson, log your stats in your workbook.

Overcoming the Clunks

Unfamiliar words slow down the engine.

Throughout the unit, identify any clunks (words you don't understand). Log the word, hunt down its exact definition, and add it to your technical vocabulary.

Your Body. Your Whānau. Your Programme.

The lab is open. Let's get to work.
