

L1 PED2

Mr Anderson

1

Learning Intention & Success Criteria

Learning Intention

Introduction to the physical anatomy of the human body, focusing on bones, muscles, joints, ligaments, and tendons in everyday and sporting contexts.

Success Criteria

- ✓ Identify bones, muscles, joints, ligaments, and tendons.
- ✓ Apply anatomical knowledge to specific sporting situations.

Expectations of Level 1

Punctuality & Prep

-  Arrive to lesson on time
-  Have equipment ready (pen, book, etc.)

Presentation Standards

Work presented neatly - **be proud of your book!**
Capital letters, full stops, correct spelling!

Learning & Participation

All home learning completed via Google Classroom
Be ready to participate; **I value your opinion!**

Classroom Management

 **1 warning then work will be completed during break time.**

Course Outline

Course Description / Course overview / Driving Question:

Our driving question is how does te ao Māori, biophysical principles and sociocultural factors influence the way we move and how does the way we move influence our hauora?

Learners will look at factors that influence participation, movement and identify solutions and strategies to improve hauora.

Learners will experience opportunities in authentic context, use anatomy and biomechanical principles, te ao Māori and sociocultural factors to develop movement and look beyond self to understand what influences hauora.

Standard:	Ideas / Context / Key learning outcomes	Timeframe	Credits
92018 1.3 External Standard Title: Demonstrate understanding of the influences of personal movement experiences on <u>hauora</u> .	 Learners will participate in physical activity and create a portfolio reflecting on their experience, how they were influenced and using a model of health explain the impact it had on their <u>hauora</u> .	8 weeks	5
92019 1.4 External Standard Title: Demonstrate understanding of influences on movement in Aotearoa New Zealand or the Pacific.	Learners will understand intrinsic and extrinsic influences on movement. They will also consider the diverse ways of understanding a movement context and the moving body. Learners will reflect on their own movements with reference to te ao Māori aspects, biophysical principles and sociocultural aspects	8 weeks	5

Golf - Golf

Golf Shot

UNDERSTANDING GOLF: AN INTRODUCTION

Golf is a precision sport, where a ball is hit with various clubs into a series of holes on a course in as few strokes as possible.

It involves strategy, mental focus, and outdoor play.

Anatomy

Bones

Muscles

Joints

Tendons

Muscle to Bone

Ligaments

Bone to Bone

Muscles and Bones

Muscles and Bones Answers

Muscles

Front

Deltoids, Pectoralis Major, Biceps, Abdominals, Obliques, Quadriceps, Tibialis anterior

Back

Trapezius, Triceps, Latissimus Dorsi, Gluteus Maximus, Hamstring, Gastrocnemius, Soleus, Erector Spinae

Bones

- Cranium
- Clavicle
- Scapula
- Sternum
- Vertebrae
- Humerus
- Ulna
- Radius
- Pelvis
- Femur
- Patella
- Fibula
- Tibia
- Talus

Types of Joint

Hinge Joint

A type of synovial joint that allows forward and backwards movement.

Action: Flexion / Extension

Ball and Socket Joint

Allows multi-directional movement: backward, forward, sideways, and rotation. Examples: shoulder and hip.

Actions: Flexion, Extension, Rotation, Abduction, Adduction

Function of the Skeletal System

Structural Framework

Acts as a framework for tendons to attach and provides support for soft tissue.

Protection

Protects internal organs from injury (e.g., ribs protecting the heart and lungs).

Movement Assistance

Tendons attach muscles to bones; muscle contraction results in body movement.

Mineral Storage

A storage depot for vital minerals like calcium needed for everyday activities.

Blood Cell Production

Red bone marrow in certain bones is the primary site of blood cell production.

Energy Storage

Triglycerides are stored in yellow bone marrow as a source of energy (esp. in children).

Quiz Questions

01.Name all the bones in the leg.

02.Name the muscles in the upper arm.

03.What is the name for the thing that connects muscles to bones?

04.How many bones does an adult human have in their body?

05.What is the correct name for the skull?

06.Name all the muscles in the leg.

07.Name two functions of the skeletal system.

08.Name a bone that protects a vital organ.

09.Name a type of joint.

10.What is the name of the thing that joins bone to bone?

L1 PED2

Mr Anderson

2

Learning Intention & Success Criteria

Learning Intention

Learners will use prior knowledge and new learning to make sense of how our joints move, which muscles make those movements happen, and how muscles work together in pairs to create smooth and controlled actions.

Success Criteria

- ✓ Identify and describe major joint movements (flexion, extension, etc.).
- ✓ Name key muscles involved in specific movements.
- ✓ Define and provide examples of antagonistic muscle pairs.
- ✓ Explain the importance of muscle pairs in coordination.

Joint Movements and Antagonistic Pairs

Watch Lesson Video

Learn about how joints move and how muscles work together in antagonistic pairs.

<https://www.youtube.com/watch?v=k0pvCEaAM3g>

OLYMPIC SPORTS

Identifying Working Muscles

<u>Video 1</u>	<u>Video 2</u>	<u>Video 3</u>

Flexion

Definition

Decreasing the angle between two body parts.

Locations

Elbow, knee, shoulder, and hip.

Examples

- Bicep curl
- Follow through when kicking a ball
- Driving knee forward when running

Extension

Definition

Increasing the angle between two body parts.

Locations

Knee, hip, elbow, and shoulder.

Examples

- Overhead pass
- Kicking a ball (knee)

Adduction

Definition

Movement towards the midline of the body. (e.g., lowering arm or leg back to the side).

Locations

Shoulder and the hip.

Example

- Bringing your arms down to your side from the outstretched position.

Abduction

Definition

Movement away from the midline of the body.

Locations

Shoulder and the hip.

Example

- Raising arms to the side.

Dorsi Flexion

Definition

Upward movement of the foot, bringing the toes closer to the shin.

Example

When you're running, your foot swings forward. Dorsiflexion *lifts your toes up* so they don't drag and make you trip!

Key Muscle

Tibialis Anterior

Plantar Flexion

Definition

The movement where you point your toes downwards, away from your shin.

Examples

- Pressing a car's gas pedal
- Standing on your tiptoes
- A ballet dancer pointing their foot

Key Muscle

Gastrocnemius

Plantar Flexion

Muscles Involved in Movement

Elbow

Flexion: Biceps Brachii

Extension: Triceps Brachii

Shoulder

Abduction: Deltoid

Adduction: Pectoralis Major, Latissimus Dorsi

Flexion: Deltoids

Extension: Latissimus Dorsi

Knee

Flexion: Hamstrings

Extension: Quadriceps Femoris

Hip

Adduction: Adductors

Abduction: Glutes / Hip Abductors

Flexion: Hip Flexor

Extension: Glute

Ankle

Dorsiflexion: Tibialis Anterior

Plantar Flexion: Gastrocnemius

Antagonistic Muscle Pairs

"Muscles can only pull, they can't push.
So how do we move a limb both ways, like
bending and straightening our arm?"

Antagonistic Muscle Pairs

Antagonistic Muscles

A pair of muscles that work in opposition to each other. When one muscle contracts (the agonist), the other muscle relaxes (the antagonist). To reverse the movement, the roles switch.

Agonist (Prime Mover)

The muscle primarily responsible for a specific movement.

Antagonist

The muscle that opposes the action of the agonist; it relaxes to allow the agonist to contract.

Bicep / Tricep

Lattisimus Dorsi / Pectoral

Quadriceps / Hamstrings

The Hamstrings

The Quadriceps

Hip Flexors / Glutes

Gastrocnemius / Tibialis Anterior

Final Task -

Think

Think of another joint movement and identify the agonist and antagonist muscles involved and a sporting example.

Pair

Discuss, in pairs, what joint movement you thought of, the muscles involved and a sporting example.

Share

Share it with the class!

L1 PED2

Mr Anderson

3

Learning Intention & Success Criteria

Learning Intention: Learners will apply prior knowledge and learning to worked examples in groups before moving to practically demonstrate their understanding.

Success Criteria

01. Identify & Describe

Major joint movements: flexion, extension, abduction, adduction, rotation, dorsiflexion, plantar flexion.

02. Key Muscles

Name key muscles involved in specific joint movements.

03. Visual Application

Apply this knowledge to images of golfers.

04. Practical Application

Apply this knowledge to your own golf swing.

Final Task

Create a poster of one of the joint movements. You must include the following,

1. Image of the joint movement with labels.
2. Definition and explanation of the joint movement.
3. Muscles involved in the joint movement (agonist and antagonist)
4. Image of the joint movement from the golf concept

L1 PED2

Mr Anderson

4

Learning Intention & Success Criteria

Learning Intention

Learners make sense of biomechanical principles related to balance and stability.

Success Criteria

01

Identify

Identify centre of gravity, base of support and line of gravity.

02

Explain

Explain the relationship between all three and how it affects balance and stability.

DO NOW

01 Identify the joints in the body and the type of joint they are.

02 Describe the 6 joint movements we have learnt.

03 Explain the different types of joint movement that can take place at each joint in the body and the antagonistic muscle pairs that work to create this movement.

Balance and Stability

Balance is a person's ability to control their equilibrium in relation to gravity only, whereas **stability** is your body's ability to "return to a desired position or trajectory following a disturbance [to equilibrium].

Equilibrium is a state of no acceleration and can be static (without movement) or dynamic (moving at a constant velocity).

Three Keys

01

Centre of Gravity

02

Base of Support

03

Line of Gravity

Centre of Gravity

Centre of Gravity

Definition

The center of gravity is the point where the total weight of an object, including a person, appears to act.

Anatomical Location

Positioning: When standing in the anatomical position (standing tall with feet slightly apart, arms at sides).

Pelvic Location: Typically located in the center of the pelvis, slightly in front of the sacrum (the bone at the base of the spine).

Common Reference: It's also often described as being roughly an inch below the navel.

Centre of Gravity

Stability and Balance

The COG plays a crucial role in balance and stability. When your COG is within your base of support (the area enclosed by your feet), you are balanced.

Balance Loss

If your COG moves outside your base of support, you will lose your balance and likely fall.

Gender Differences

- **Males:** Higher COG due to larger shoulder mass.
- **Females:** Lower COG due to larger pelvis.

Base of Support

Base of Support

Definition

The BoS is the area formed by the perimeter of all points where an object or person is in contact with the ground or supporting surface.

Examples

Standing

Your BoS is the area between your feet.

Sitting

The area where your body (e.g., buttocks) makes contact with the chair.

Leaning

The area where your back makes contact with the wall.

Base of Support

How to increase stability:

- **Widen your BoS:** Extend your feet further apart, or use your hands for support.
- **Lower your COG:** Bend your knees or squat, which lowers your center of gravity and makes it harder for your COG to fall outside the BoS.

Examples in sports

Sprinter Start

A sprinter has a large BoS due to both hands and feet being in contact with the ground.

Netball Pivot

A netball player pivoting on one foot has a smaller BoS compared to a sprinter.

Line of Gravity

Line of Gravity

Line of Gravity (LOG)

The LOG is a vertical line that extends from the COG down to the ground or surface the object is on.

Balance and Stability

The position of the LOG in relation to the base of support (the area of contact with the ground) is crucial for balance and stability.

Stability Rule

When the LOG falls within the base of support, the object is considered stable; if it falls outside, the object is unstable and requires corrective actions.

L1 PED2

Mr Anderson

5

Do Now

Task

Explain what the centre of gravity, base of support and line of gravity are, how they are linked and they ensure balance and stability.

01. Define

Provide clear definitions for all three key terms.

02. Connection

Describe how these three concepts are linked to each other.

03. Stability

Analyse the relationship between the three in relation to balance and stability.

Practical

L1 PED2

Mr Anderson

6

Do Now

Task -

1. In groups label the centre of gravity, line of gravity and base of support on the images of the golfers.

Learning Intention & Success Criteria

Learning Intention: Learners make sense of biomechanical principles related to force summation and apply it to the movement of golf.

Success Criteria

01

Identify the four ways to create as much force as possible.

02

Explain how force summation is applied in a golf setting.

Force Summation

In order to generate momentum, a force must be applied to the object. The total momentum given is determined by the **sum of all forces** generated by different body parts.

Two Keys

01. Creating Force

02. Applying Force

Force Summation

<https://www.youtube.com/watch?v=IAM13dD8uAw>

How can we generate maximum force?

01. More Muscles

The first way we can create more force is through using more muscles **(motor units)**.

The more body parts used, the greater the production of force.

How can we generate maximum force?

02. Correct Sequencing

The second way to generate more force is to recruit muscles in the **correct order**.

We start by recruiting our **biggest, central muscles** (quads, glutes, hamstrings).

The **smaller, distal muscles** go last (biceps and triceps).

How can we generate maximum force?

03. Correct Timing

Muscles need to be recruited with the **correct timing**.

Each muscle should be moved at the exact time the previous one begins to slow down.

This ensures no force is lost, allowing the last body part to transfer the **maximum speed** to the object.

How can we generate maximum force?

04. Greater Range of Motion

Each muscle should go through its **greatest range of motion**.

This allows it to **accelerate** to its maximum speed and generate **maximum force**.

How can we apply this to golf?

Application Task

In order to perform better in golf we can apply **force summation**.

Your Task:

Explain how you would apply force summation to your golf swing to ensure you can **hit the ball further**?

L1 PED2

Mr Anderson

7

Do Now - who is this man?

https://www.youtube.com/watch?v=JGO_zDWmkvk

Learning Intention & Success Criteria

Learning Intention

Learners make sense of biomechanical principles related to Newton's Laws and apply it to the movement of golf.

Success Criteria

Identify

Identify the three 'Newton's Laws'.

Explain

Explain each law in detail.

Apply

Explain how Newton's Laws are applied in a golf setting.

Newton's First Law

DEFINITION

An object at rest stays at rest, and an object in motion stays in motion with the same speed and in the same direction unless acted upon by an **unbalanced force**.

Inertia: Resistance to change in motion.

Unbalanced Force: Causes a change in velocity.

Newton's First Law - Applied

Scenario 1: At Rest

In golf we can see Newton's first law in action when the ball is still on the ground or on a tee.

"It does not move until an external force (you hitting the ball) occurs."

Scenario 2: In Motion

When the ball is in the air, it will continue at the same speed until acted upon by external forces.

- Gravity (pulls it down)
- Air Resistance (slows it down)

Newton's Second Law

DEFINITION

"The acceleration of an object is directly proportional to the net force acting on it and **inversely proportional to its mass.**"

Σ **Formula:** $F=ma$ (Force = mass $\times$ acceleration)

Acceleration: Directly tied to net force and mass.

Newton's Second Law - Applied

Scenario 1: Force & Acceleration

More force means more acceleration (if mass is constant).

"If we apply more force (swing harder) when using the same golf ball, it should go f

Scenario 2: Mass & Acceleration

More mass means less acceleration (if force is constant).

"If we apply the same force to the practice ball and the real golf ball, the practice ball has greater acceleration."

Newton's Third Law

DEFINITION

"For every action, there is an equal and opposite reaction."

Force Pairs

Forces always occur in pairs. When object A exerts a force on object B, object B exerts an equal and opposite force on object A.

L1 PED2

Mr Anderson

7

Do Now -

EXEMPLAR ANALYSIS

Read the exemplar given to your group.

Highlight key terminology, sentences, and words that will gain marks.

Identify anything else you feel is important for the task.

Learning Intention & Success Criteria

LEARNING INTENTION

Learners will apply their knowledge of biomechanical principles to their assessment context.

Assessment - 1.4

Candidates will select ONE influence from within **sociocultural**, and ONE influence from within EITHER te ao Māori or biophysical principles. While both specified influences must be applied to the same movement context, candidates must not interrelate them in their description.

Candidates will be required to produce a portfolio, in response to an assessment activity provided by NZQA, that demonstrates their understanding of TWO different influences on ONE movement context in Aotearoa New Zealand or the Pacific.

Task

Describe the influence of a **biophysical principle** on a movement context (**golf**).

Think about how it has affected your experience and use examples of your own participation.

Refer to the Success Criteria for detailed requirements.

Example

The biomechanical principle force summation also positively influenced me in my movement context Golf. Force Summation is the combined sum of all forces produced by each body part to exert onto an object or force and is crucial to successfully and optimally carry out the movements in Golf. For optimal force application in a given movement you must express force summation with correct factors including correct sequencing, correct timing, large variety of muscles and high range of motion. When thinking about the golf swing, and my experience, I have applied force summation to help me hit the ball further. When performing a golf swing in order to hit the ball further I ensure I use as many muscles as possible. This involves using lower body muscles such as quadriceps, hamstrings and glutes as well as my abdominals and obliques and finally my upper body muscles such as pectorals, latissimus dorsi, deltoids, biceps and triceps. Considering the other factors of force summation, I have applied correct sequencing to ensure I use my lower body first, then my core then my upper body muscles. Similarly to this I ensure I use correct timing, by using each muscle as the force production from the previous muscle is reducing. For example when swinging I will use my leg muscles first and as they begin to decrease their force produces I begin to use my abdominals and then finally my upper body muscles like my triceps and biceps. When considering how to increase range of motion in my golf swing I need to ensure I twist fully and ensure full range of motion in my hips, shoulder and elbow to increase the amount of force produced and hit the ball further.

Success Criteria

01. Definition

Definition of Biophysical Principle you are writing about.

02. Application

Application of your chosen principle to our movement context (golf).

03. Personal Examples

Examples from your own experience.

04. Performance Impact

How does the principle you have chosen improve your golf swing/performance.

✓ Ensure all four criteria are addressed in your final submission.

L1 PED2

Mr Anderson

8

Learning Intention & Success Criteria

Learning Intention

Learners will apply their knowledge of biomechanical principles to their assessment context.

01. Analyze Principles

Identify and define relevant biomechanical principles.

02. Movement Context

Apply principles to the specific assessment movement.

Demonstrate clear understanding through practical application.

Today's Task -

Create an infographic about either force summation or balance and stability.

Include the following,

1. Definition
2. Key information about the topic
3. Images of the topic being applied in golf
4. Examples from your golf experience
5. Anything else you feel necessary

These will be laminated and stuck on the wall so please make sure they are well presented and clearly show your understanding of the topic.

<https://www.youtube.com/watch?v=me5gjIUe1Ks>

L1 PED2

Mr Anderson

8

Do Now: Sports Access

The Challenge

Think about your own community. What is stopping people your age from playing?

- List all potential **barriers** for a 16-year-old trying to get into a new sport.
- Consider social, financial, and physical factors.
- Be ready to share your top 3 with the class.

Socio-Cultural Factors

Economic Cost

Financial barriers that impact participation.

- Equipment & gear
- Club & tournament fees
- Transport expenses

Location

Physical and geographic access to movement.

- Proximity to facilities
- Available local spaces
- Travel requirements

Stereotypes

Societal assumptions based on gender identity.

- "Boy" vs "Girl" sports
- Physical expectations
- Media representations

Research Task: Equipment Barriers

Activity: Pricing New Zealand Golf

Investigate the cost of starting golf for a 16-year-old beginner in your local area and greater Auckland.

- Identify 3 different stores (Online vs. Local Pro Shop).
- Compare "Starter Set" prices vs. buying individual clubs (Driver, Putter, Irons).
- Research "Junior" vs. "Adult" membership rates for 16-year-olds at two local courses.
- Consider the cost of essential accessories (Gloves, Balls, Tees).

Goal: Determine if cost is an "Enabler" or a "Barrier" for your peer group.

Reflection Task: Cost of Golf

Consolidating Your Findings

Based on today's research, reflect on the financial implications of taking up golf as a 16-year-old beginner in Auckland.

- Is golf an **"Enabler"** that fosters physical activity, or a **"Barrier"** that excludes youth?
- How do these costs compare to other sports you play?
- What potential solutions could make golf more accessible?

Task: Write a 1-paragraph conclusion summarizing your personal stance supported by your pricing data.

Influence 1:

Sociocultural

- Identify a sociocultural influence that affected your chosen physical discipline or sport.
- Explain how and why the sociocultural influence affected your chosen physical discipline or sport with a specific example from your own participation.
- Draw conclusions about what you have learned from the impact of this sociocultural influence and how you could apply this learning to enhance your future performance in movement.

Influence 2:

Te ao Māori influence OR biophysical influence

- Identify a te ao Māori or biophysical influence that affected your chosen physical discipline or sport.
- Explain how and why the influence affected your chosen physical discipline or sport with a specific example from your own participation.
- Draw conclusions about what you have learned from the impact of this influence and how you could apply this learning to enhance your future performance in movement. Note: Discuss each influence independently, without interrelating them.

Evaluate the impact of the following socio-cultural factors on your performance in a sport. Use examples to explain how it has affected your performance and how it will impact your future involvement in sport.

<u>Cost</u>	<u>Location</u>	<u>Stereotypes</u>

My Example Answer

The first socio-cultural impact I am going to talk about is Stereotypes. In golf the typical people that play are rich, white people that are retired. This has meant there is a lack of role models for me within the sport.

Similarly to this there are no professional golfers from my local area therefore no one is inspiring me to get involved with the sport. The impact this has had on my experience with golf has been negative. I have never played golf at a golf course and I have never been to a driving range. The first time I ever held a golf club was in my PE lesson at the start of the semester. Another experience we had was at the driving range. This was a similar situation with a lack of role models there meaning there was a lack of inspiration for me to get involved with the sport. The future impact this will have on me playing golf will be negative however the experience has school has increased how accessible the sport is.

Response Checklist

- 1. Identify the Influence:** State clearly whether you are discussing cost, location or stereotypes
- 2. Explain the Impact:** Describe exactly how and why this factor influenced your golf experience.
- 3. Personal Evidence:** Provide a concrete example from your own participation in class.
- 4. Future Impact:** Draw a direct conclusion on how you will apply this knowledge to improve your future performance.

Tuakana-Teina

- Tuakana-teina is a Māori concept that refers to the relationship between an older, more experienced individual (tuakana) and a younger, less experienced individual (teina), often used in mentorship and peer support settings.
- Older/more skilled player mentoring a less experienced player.
- EG - Mr Anderson helping us in our golf lessons.

Kaitiakitanga

- Kaitiakitanga is a Māori concept encompassing guardianship, protection, and conservation of the natural environment and its resources. It involves a responsibility to care for the land, waters, and all living things.
- Respecting and looking after the golf course, repairing divots, keeping the space safe.
- We use a matt in lessons to make sure we do not ruin the school fields and so other learners can use them.

Tapu

- A supernatural condition. A person, place or thing is dedicated to an atua and is thus removed from the sphere of the profane and put into the sphere of the sacred.
- Sacredness, respect for boundaries, rules, and safety.
- Wait behind the striking area.
- Keep quiet while others swing.
- Follow order of play.

L1 PED2

Mr Anderson

9

Do Now -

List all the te ao Māori and sociocultural principles we have covered in class with definitions / explanations.

Task

Explain ONE influence from within te ao Māori and socio-cultural factors on yourself within the movement concept of golf.

Reflection

One example of *Tuākana–Tēina* you saw or used today.

One example of *Kaitiakitanga* during the session.

One example of *Tapu* in golf rules or etiquette.

Task: Three Influences

Sociocultural

Explain how cost, location, or stereotypes influenced your engagement and performance during with the movement context.

Biophysical

Explain how force summation or balance and stability had an impact on your performance of the movement context.

Te Ao Māori

Reflect on how concepts like Kaitiakitanga, Tapu, or Tuākana-Tēina influenced your experience in the movement context.

1.4 Practice Assessment

Preparation Task

To prepare for your practice assessment on Wednesday, please plan your response in your books. You must select **two influences** in total as outlined below:

REQUIRED

1. Sociocultural

Identify how social or cultural factors impacted your experience.

- Examine influences such as cost, location, or societal stereotypes.
- Explain how these factors shaped your engagement.
- Reflect on their direct impact on your golf performance.

CHOOSE ONE

2. Second Influence

Select either Biomechanical OR Te Ao Māori:

Option A: Biomechanical

Focus on physical principles like force summation, balance, and stability.

Option B: Te Ao Māori

Incorporate cultural concepts such as Kaitiakitanga, Tapu, or Tuākana–Tēina.

Influence 1: Sociocultural • Identify a sociocultural influence that affected your chosen physical discipline or sport. • Explain how and why the sociocultural influence affected your chosen physical discipline or sport with a specific example from your own participation. • Draw conclusions about what you have learned from the impact of this sociocultural influence and how you could apply this learning to enhance your future performance in movement.

Influence 2: Te ao Māori influence OR biophysical influence • Identify a te ao Māori or biophysical influence that affected your chosen physical discipline or sport. • Explain how and why the influence affected your chosen physical discipline or sport with a specific example from your own participation. • Draw conclusions about what you have learned from the impact of this influence and how you could apply this learning to enhance your future performance in movement.

Do Now

1

1.4 Assessment Preparation

Cue Card Creation Task

To prepare for your upcoming 1.4 assessment, you will create structured study cue cards. These highly focused memory aids will serve as your ultimate reference guides during revision.

FRONT OF CARD

Key Concepts & Prompts

- Write down the core terminology or chosen movement context clearly.
- Include high-level prompt questions to test your memory recall active learning.
- Keep the design clean, bold, and minimal to ensure quick scanning.

BACK OF CARD

Cue Card Instructions

Step 1: Write Your Preparation Cue Cards

Using your planning from your books, create study cue cards for your **two selected influences**. These will serve as your ultimate reference guides during the assessment.

INFLUENCE 1: REQUIRED

Sociocultural

Create cue cards based on social or cultural factors:

- Identify how factors (cost, location, stereotypes) impacted your sport experience.
- Explain how these forces shaped your active engagement.
- Reflect on the direct impact they had on your physical golf performance.

INFLUENCE 2: CHOOSE ONE

Biomechanical OR Māori

Create cue cards for your chosen second influence:

- **Option A: Biomechanical**
Focus on physical movement principles such as force summation, balance, and stability.
- **Option B: Te Ao Māori**
Incorporate cultural principles such as Kaitiakitanga, Tapu, or Tuākana-Tēina in movement.

Cue Card Assembly

Step 2: Reinforce and Bind Your Cards

Follow these physical assembly instructions to transform your study notes into a durable, functional pocket revision deck that survives heavy study sessions.

STEP 2A: REINFORCE

Laminate & Strengthen

Ensure your physical cue cards last:

- Glue your finished yellow paper planning notes onto thick, heavy-duty cardboard or card stock.
- Trimming any excess borders guarantees clean edges that won't easily fray, tear, or bend during transport.
- Creating a solid structural backing makes the entire deck feel premium and professional.

STEP 2B: BIND

Cue Card Checklist

What to Include on Your Cards

Before you assemble your pocket deck, verify that your cue cards contain all the necessary evidence and analytical prompts required for the 1.4 assessment.

CONTENT CHECKLIST

Required Elements

- **Clear Core Terminology:** Explicitly name each chosen physical or sociocultural influence.
- **Personal Experience:** Detail exactly how these factors impacted your golf gameplay.
- **Anatomy of Movement:** Include specific anatomical and biomechanical descriptions or Te Ao Māori concepts.
- **Active Prompts:** Bold question prompts on the front to trigger quick recall during revision.
